Agonists of this response antagonize early stages of virulence, specifically production of cell wall proteins (so are preferred for prophylaxis) while antagonists interfere with the later stages of virulence, specifically secretion of exotoxin (so are preferred for treatment). The peptides are used to treat or prevent bacterial infections in humans and animals, also for incorporation into medical articles, e.g tampons (to prevent toxic shock syndrome), prostheses and wound dressings. Particularly they are active against staphylococci, specifically Staphylococcus arreus but also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Affas ZM,

The invention relates to AgrD derived peptides, a composition containing a peptide and a carrier and a method for the production of the cyclic peptides. The peptide inhibits the agr response, which is normally associated with the release of virulence factors of Staphylococcus aureus. An AgrD peptide is produced by S. aureus that activates the agr response in strains of a single group, but interferes with this response in strains of different groups. The peptides and composition containing them can be used to treat infections by S. aureus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim

The present sequence is that of a novel synthetic cyclic peptide of the invention that is capable of inhibiting the agr response of Staphylococcus aureus. It is an AgrD-autoinducing peptide, where AgrD is a secreted agr-encoded peptide and where the agr locus controls the synthesis of virulence factor and other extracellular proteins responsible for pathogenicity in S. aureus. Preferred peptides may have the sequence NH2-X(n)-Z-X(y)-COOH, with a cyclic bond between the Z residue and COOH other than a thioester bond, where X is an amino acid, an amino acid analogue, a peptidomimetic or non-amide isostere, Z is a synthetic or a biosynthetic amino acid, n is 0-10 and y is 1-10. The cyclic bond is especially a lactam or lactone bond. The thiololactone

Elimination of the thiol ester component of the cyclic ring structure can destroy agr response activating activity while preserving and enhancing inhibitory activity. A claimed method of preparing a cyclic peptide involves: assembling a linear peptide chain on to a solid phase resin support; deprotecting the resulting protected assembled peptide; treating to deprotected peptide with neutral buffer for a time sufficient to form the cyclic peptide and cleave the peptide from the support; and recovering the cyclic peptide. The peptide is useful for bacterial interference, especially for the treatment of S. aureus
                                                                                                                                                                   The peptide was isolated from Fusinus perplex ferrugineus neuroganglia and inhibits muscular contraction, especially of the radular tractile muscle in F. perplex ferrugineus, Prosobranchia and other Mollusca. Alternatively, it can be synthesised by solidaphase techniques. One or both of the Ser residues at positions 1 or 2 may be absent. The peptide can be used in biological studies for the development of drugs. See also AAR10516-R10518 and AAR10520.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Muscular contraction-inhibitory neuro-peptide(s) in mollusca prepd. by purifying oligopeptide using high power liq. chromatography after extracting neuro-ganglion of Fusinus per

F۷,

Labelled functional surrogate of an analyte - useful as competitor molecule in affinity assays, esp. for detecting large macromolecules such as ferritin

Claim 51; Page 56; 156pp; English

PRESULT 6
ADMIN 783
ADMIN CThis sequence represents a peptide motif derived from ferritin which is comportant for selective binding affinity. Peptides containing motifs consuch as this may be used as functional surrogates in the conjugate of the invention. The novel labelled conjugate comprises at least one can label attached to a functional surrogate of an analyte of interest. The surrogate is capable of competing effectively with the analyte conjugate exhibits an activity that is altered upon interaction with the amount of the analyte present in a sample. Functional surrogate is conjugate exhibits an activity that is altered upon interaction with the analyte present in a sample. Functional surrogate to compete effectively and with the analyte for a limiting amount of its conjugate and with the analyte for a limiting amount of its cocurring analytes. They can be labelled for use in standard competitive macromolecules such as polypeptides, polypactarides, polypuctening analytes. They can be labelled for use in standard competitive can present in force analytes as sociated with infectious disease. In particular, the assays care useful for detecting ferritin, follicle stimulating hormone, human conjucted with infectious disease. In particular, them, human conjucted in parathycoid hormone, human luteinising hormone, human probaction, Streptococcus a, rubella, toxoplasma, herpes virus, DK-ME, competition, dated to the analytes.

Lee-owen (CYTO-) CYTOGEN CORP F۷ Carter 9508-0476375

Labelled functional surrogate of an analyte - useful as competitor molecule in affinity assays, esp. for detecting large macromolecules such as ferritin

Claim 51; 26; 156pp; English

This sequence represents a synthetic ferritin peptide which was used as functional surrogate in the conjugate of the invention. The novel considered to a functional surrogate in the conjugate of the invention. The novel can be abled conjugate comprises at least one label attached to a functional surrogate of an analyte of interest. The surrogate is capable of competing effectively with the analyte for a limiting amount of an cativity receptor for the analyte. The conjugate exhibits an activity that is altered upon interaction with the affinity receptor and this cativity can be measured and related to the amount of the analyte present in a sample. Functional surrogates such as this have an immunoreactive group that allows the surrogate to compete effectively and with the cannot that of a sample. Functional compete for a limiting amount of its affinity receptor. Functional configurates are able to mimic naturally occurring analytes. They can be labelled for use in standard competitive affinity assays (esp. conogenous immunoassays) for detecting large macromolecules such as polymeptides, polymerides, glycoproteins and compatitions acromolecules. Such as well as amail hantens Turvical polypeptides, polysaccharides, p lipid-containing macromolecules, as well as small

The novel labelled conjugate comprises at least one label attached to a functional surrogate of an analyte of interest. The surrogate is capable of competing effectively with the analyte for a limiting amount of an affinity receptor for the analyte. The conjugate exhibits an activity that is altered upon interaction with the affinity receptor and this activity can be measured and related to the amount of the analyte present in a sample. Functional surrogate such as this have an immunoreactive group that allows the surrogate to compete effectively and with the analyte for a limiting amount of its affinity receptor.

CY This sequence represents a peptide motif derived from ferritin which is comportant for selective binding affinity. Peptides containing motifs consuch as this may be used as functional surrogates in the conjugate of the invention. The novel labelled conjugate comprises at least one companies at least one companies. The conjugate of an analyte of interest. The surrogate is capable of competing effectively with the analyte conjugate exhibits an activity that is altered upon interaction with the affinity receptor and this activity can be measured and related to the affinity receptor and this activity can be measured and related to compute effectively and with the analyte for a limiting amount of its compete effectively and with the analyte for a limiting amount of its compete effectively and with the analyte for a limiting amount of its compete effectively and with the analyte for a limiting amount of its compete effectively and with the analyte for a limiting amount of its compete effectively and with the analyte for use in standard competitive competical surrogates are able to mimic naturally occurring analytes (esp. homogenous immunoassays) for detecting large comproperciens and lipid-containing macromolecules, as well as small compositive associated with infectious disease. In particular, the assays can be abelted to fertility-pregnancy or canalytes associated with infectious disease. In particular, the assays considered with infectious disease. In particular, the assays considered with infectious disease. In particular, the assays considered with infectious disease. In particular, the analyte for a limit of them one, human considered to the proper considered with infectious disease. In particular, the analyte for a limit of the proper considered with infectious disease. In particular, then, human considered to the proper considered with infectious disease. In particular, then, human considered to the proper considered with infectious disease. In particular, then, human considered to the proper considered wi

                                                                                                                                                                                                                                                                                                                                                                            CC conjugate exhibits an activity that is altered upon interaction with CC the affinity receptor and this activity can be measured and related to the affinity receptor and this activity can be measured and related to CC compete effectively and with the analyte for a limiting amount of its CC compete effectively and with the analyte for a limiting amount of its CC affinity receptor. Functional surrogates are able to mimic naturally CC convering analytes. They can be labelled for use in standard competitive CC affinity assays (esp. homogenous immunoassays) for detecting large CC macromolecules such as polypeptides, polysaccharides, polynucleotides, [CC glycoproteins and lipid-containing macromolecules, as well as small CC tumour markers, allergens, hormones related to fertility-pregnancy or CC analytes associated with infectious disease. In particular, the assays CC are useful for detecting ferritin, follicle stimulating hormone, human CC containty contains and lipid-contains disease. In particular, the assays CC are useful for detecting ferritin, follicle stimulating hormone, human CC contains a streptococcus a, rubella, toxoplasma, berpes virus, DK-MB, CC myoglobin, myosin light chain, troponin, carcinoembryonic antigen, CC (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                            g
                                                                                                                                   RESULT 12

Peptides containing motifs such as this may be used as functional surrogates in the conjugate of the invention. The novel labelled conjugate comprises at least one label attached to a functional surrogate of an analyte of interest. The surrogate is capable of competing effectively with the analyte for a limiting amount of an affinity receptor for the analyte. The

Claim 51; Page 56; 156pp; English

CC such as this may be used as functional surrogates in the conjugate of the invention. The novel labelled conjugate comprises at least one Clabel attached to a functional surrogate of an analyte of interest. CC The surrogate is capable of competing effectively with the analyte CC for a limiting amount of an affinity receptor for the analyte. The CC conjugate exhibits an activity that is altered upon interaction with CC the affinity receptor and this activity can be measured and related to CC the amount of the analyte present in a sample. Functional surrogate s such as this have an immunoreactive group that allows the surrogates CC compete effectively and with the analyte for a limiting amount of its cc conjugate string analytes. They can be labelled for use in standard competitive concurring analytes. They can be labelled for use in standard competitive concurring analytes such as polypeptides, polysaccharides, polynucleotides, glycoproteins and lipid-containing macromolecules, as well as small containing macromolecul This sequence represents a peptide motif derived from ferritin which important for selective binding affinity. Peptides containing motifs containing motifs 18

                                                                                                                                                                                                                                                                                                           important for selective binding affinity. Peptides containing motifs such as this may be used as functional surrogates in the conjugate of the invention. The novel labelled conjugate comprises at least one can be surrogated in the conjugate of the invention. The novel labelled conjugate comprises at least one can be surrogated is capable of competing effectively with the analyte of a limiting amount of an affinity receptor for the analyte. The conjugate exhibits an activity that is altered upon interaction with the affinity receptor and this activity can be measured and related to the amount of the analyte present in a sample. Functional surrogates such as this have an immunoreactive group that allows the surrogate to compete effectively and with the analyte for a limiting amount of its affinity receptor. Functional surrogates are able to maint on the competitive affinity analytes. They can be labelled for use in standard competitive affinity assays (esp. homogenous immunosassys) for detecting large macromal english such as nolvestides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Functional surrogate; analyte; affinity receptor; immunoreactive group; mimic; homogenous immunoassay; detection; diagnostic analyte; Chlamydia; cardiac marker; tumour marker; allergen; hormone; fertility; myoglobin; pregnancy; infectious disease; ferritin; myosin light chain; troponin; follicle stimulating hormone; human; growth hormone; immunoglobulin E; prolactin; parathyroid hormone; placental lactogen; hepatitis antigen; antibody; chorionic gonadotropin; luteinising hormone; cytomegalovirus; streptococcus; rubella; toxoplasma; DK-MB; prostate-specific antigen; carcinoembryonic antigen; alpha-fetoprotein; herpes virus; CA125.
macromolecules such as polypeptides, polypaccharides, as well as small haptens. Typical diagnostic analytes for detection include cardiac or tumour markers, allergens, hormones related to fertility-pregnancy or analytes associated with infectious disease. In particular, the assays are useful for detecting ferritin, follicle stimulating hormone, human growth hormone, immunoglobulin E, prolactin, parathyroid hormone, human placental lactogen, hepatitis antigens or antibodies against them, human chorionic gonadotropin, human luteinising hormone, cytomegalovirus, Chlamydia, Streptococcus a, rubella, toxoplasma, herpes virus, DK-MB, myoglobin, myosin light chain, troponin, carcinoembryonic antigen, alpha-fetoprotein, prostate-specific antigen and CA125 (a tumour marker). (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Labelled functional surrogate of an analyte - useful as competitor molecule in affinity assays, esp. for detecting large macromolecules

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SX
This sequence represents a peptide motif derived from ferritin which is comportant for selective binding affinity. Peptides containing motifs consumers this may be used as functional surrogates in the conjugate of the invention. The novel labelled conjugate comprises at least one conjugate is capable of competing effectively with the analyte conjugate is capable of competing effectively with the analyte conjugate exhibits an activity that is altered upon interaction with the affinity receptor and this activity can be measured and related to the affinity receptor and this activity can be measured and related to the amount of the analyte present in a sample. Functional surrogates such as this have an immunoreactive group that allows the surrogate to compete effectively and with the analyte for a limiting amount of its affinity receptor. They can be labelled for use in standard competitive affinity assays (esp. homogenous immunosasys) for detecting large conformal surrogates are able to mimic naturally assays (esp. homogenous immunosasys) for detecting large conformal surrogates are solventian and lipid-containing macromolecules, as well as small conformation and lipid-containing macromolecules, as small as small conformation include cardiac or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

The invention describes a method of producing soluble human leukocyte antigen (HLA) molecules (SHLA) in cell pharm involving amplifying HLA allelic DNA by PCR using a locus specific primer to produce truncated a PCR product (PI), inserting P1 into mammalian expression vector; electroporating the plasmid into a host cell; inoculating the cell pharm with the host cell such that cell pharm produces SHLA. A multimeric HLA complex (I) is useful for testing functionality of peptide ligands bound by at least two soluble HLA molecules. (I) can be tested for its ability to serve as ligands for cytotoxic T lymphocytes (CTLs) and induce immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   tumour markers, allergens, hormones related to fertility-pregnancy or analytes associated with infectious disease. In particular, the assays are useful for detecting ferritin, follicle stimulating hormone, human growth hormone, immunoglobulin E, prolactin, parathyroid hormone, human placental lactogen, hepatitis antigens or antibodies against them, human chorionic gonadotropin, human lutteinising hormone, cytomegalovirus, Chlamydia, Streptococcus a, rubella, toxoplasma, herpes virus, DK-MB, myoglobin, myosin light chain, troponin, carcinoembryonic antigen, alpha-fetoprotein, prostate-specific antigen and CA125 (a tumour marker) (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Soluble human leukocyte antigen; HLA; sHLA; cell pharm; multimeric HLA complex; cytotoxic T lymphocytes; CTL; immune response; viral infection; cancer; autoimmune disease; vaccine development; MHC; major histocompatibility complex; diagnostic development; HLA class I polymorphism; HLA-B15 allotype.
                                                                                                                                                                                                                                                                                            Disclosure; Page 172; 300pp; English.

CC responses in humans. (I) is useful for studying T cell responses to capathological conditions such as viral infections and cancer, and for modulating the human immune system to induce tolerance in autoimmune capacity diseases. The individual secreted major histocompatibility complex (MHC) can development) and to the development of diagnostics. With the capacity response of the development of diagnostics. With the secreted MHC molecules, naturally loaded peptides can be eluted from the capacity for the development of diagnostics. With the secreted MHC molecules allow the capacity for the peptide pools extracted from series of distinct yet related class I HHA-BIS allotypes; compare the different ligand maps to identify potentially shared elements; and characterise the elements constitutely potentially shared elements; and characterise the elements of coverlapping ligands. The truncated version of (MHC) can be produced in mammalian or insect/bacterial cells such that milligram or greater quantities of an individual class I or class II molecule can be obtained. The sequence represents a HLA (human leukocyte antigen) epitope.

                                                                                                                                               "LOSS of all ndh genes as determined by sequencing the entire chloroplast genome of the black pine Pinus thunbergii.";

Proc. Natl. Acad. Sci. U.S.A. 91:9794-9798(1994).

-!- FUNCTION: THE CYTOCHROME B6-F COMPLEX FUNCTIONS IN THE LINEAR CROSS-MEMBRANE TRANSPORT OF ELECTRONS BETWEEN PHOTOSYSTEM II AND I. AS WELL AS IN CYCLIC ELECTRON FLOW AROUND PHOTOSYSTEM I. PETL IS IMPORTANT FOR PHOTOAUTOTROPHIC GROWTH AS WELL AS FOR ELECTRON TRANSFER EFFICIENCY AND STABILITY OF THE CYTOCHROME B6-F COMPLEX.

-!- SUBCELLULAR LOCATION: Thylakoid membrane-associated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 EMBL; X07663; CAA30510.1; -.

-I- FUNCTION: BIDIRECTIONALLY DEGRADES SINGLE-STRANDED DNA INTO LARGI ACID-INSOLUBLE OLIGONUCLEOTIDES, WHICH ARE THEN DEGRADED FURTHER INTO ENALL ACID-SOLUBLE OLIGONUCLEOTIDES (BY SIMILARITY).

-I- CATALYTIC ACTIVITY: Exonucleolytic cleavage in either 5'- to 3'- to 5'-direction to yield nucleoside 5'-phosphates.

-I- SUBUNIT: Heterooligomer composed of large and small subunits (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MEDLINE=99206606; PubMed=10192388;

                                                                                                                                                                                                                                                                                                                                      SUBUNIT: The main subunits of complex b-cl are: cytochrome cytochrome cl and the Rieske protein (By similarity). SIMILARITY: Belongs to the cytochrome b family.
                                                                                                                                                                                                                                                                                                                                                                                                      FUNCTION: Component of the ubiquinol-cytochrome c red complex (complex III or cytochrome b-c1 complex), whi respiratory chain that generates an electrochemical p coupled to ATP synthesis (By similarity). Grace COPACTOR: Binds two heme groups non-covalently. Heme b562) is low-potential and absorbs at about 562, and or b566) is high-potential and absorbs at about 566 (
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               31 SSLF 34
